In this paper, by applying the Hohlov linear operator, connections between the class $SD(\alpha)$, $\alpha \geq 0$, and two subclasses of the class A of normalized analytic functions are established. Also an integral operator related to hypergeometric function is considered.

1. Introduction

Let A denote the family of functions f that are analytic in the open unit disk $\Delta = \{z : |z| < 1\}$ with the normalization

$$f(z) = z + \sum_{n=2}^{\infty} a_n z^n. \quad (1)$$

Let S denote the subclass of functions in A which are also univalent in Δ . A well-known subclass of S is the class ST (see, e.g., [1]) of starlike functions f of the form (1), satisfying $\operatorname{Re}\{zf'(z)/f(z)\} > 0$, $z \in \Delta$. Another class $UCD(\alpha)$, $\alpha \geq 0$, introduced in [2], consists of functions $f \in A$ satisfying $\operatorname{Re}\{f'(z)\} \geq \alpha|zf''(z)|$, $z \in \Delta$. Various properties of this class have been obtained in [2–4]. A related class $SD(\alpha)$ has been recently considered in [5], initially introduced in [6]. A function f of the form (1) is said to be in the class $SD(\alpha)$ if

$$\operatorname{Re}\left\{\frac{f(z)}{z}\right\} \geq \alpha \left|f'(z) - \frac{f(z)}{z}\right|, \quad \text{for } \alpha \geq 0. \quad (2)$$

Theorem 1 (see [5]). *A function f of the form (1) is in the class $SD(\alpha)$ if*

$$\sum_{n=2}^{\infty} [1 + \alpha(n-1)] |a_n| \leq 1. \quad (3)$$

Ponnusamy and Ronning [7] introduced and studied the class $R_\eta(\beta) \subset S$, ($0 \leq \beta < 1$) of functions $f \in A$ for which there

exists a number $\eta \in (-\pi/2, \pi/2)$ such that $\operatorname{Re}\{e^{i\eta}[f'(z) - \beta]\} > 0$, $z \in \Delta$. If the function f of the form (1) belongs to the class $R_\eta(\beta)$, then

$$|a_n| \leq \frac{2(1-\beta)\cos\eta}{n}, \quad (n \in N \setminus \{1\}). \quad (4)$$

For complex numbers a , b , and c ($c \neq 0, -1, -2, \dots$), the Gaussian hypergeometric function ${}_2F_1(z)$ is defined by

$${}_2F_1(z) = {}_2F_1(a, b, c; z) = \sum_{n=0}^{\infty} \frac{(a)_n (b)_n z^n}{(c)_n n!}, \quad (5)$$

where $(\lambda)_n$ is the Pochhammer symbol given by

$$(\lambda)_n = \begin{cases} 1, & n = 0 \\ \lambda(\lambda+1)(\lambda+2)\cdots(\lambda+n-1), & n \in N \end{cases} \quad (6)$$

$$= \frac{\Gamma(\lambda+n)}{\Gamma(\lambda)}.$$

It is known that

$${}_2F_1(a, b, c; 1) = \frac{\Gamma(c)\Gamma(c-a-b)}{\Gamma(c-a)\Gamma(c-b)}, \quad (7)$$

$$\operatorname{Re}(c-a-b) > 0, \quad c \neq 0, -1, -2, \dots$$

The Hadamard product (or convolution) of two functions f defined by (1) and g given by $g(z) = z + \sum_{n=2}^{\infty} b_n z^n$ is defined by

$$(f * g)(z) = z + \sum_{n=2}^{\infty} a_n b_n z^n. \tag{8}$$

Hohlov [8] introduced a linear operator $I_{a,b,c} : A \rightarrow A$, corresponding to the Gaussian hypergeometric function ${}_2F_1$ which is defined by the convolution

$$[I_{a,b,c}(f)](z) = z {}_2F_1(a, b, c, z) * f(z), \quad f \in A. \tag{9}$$

For a function f of the form (1), we have

$$(I_{a,b,c}(f))(z) = z + \sum_{n=2}^{\infty} \frac{(a)_{n-1} (b)_{n-1}}{(c)_{n-1} (1)_{n-1}} a_n z^n, \quad z \in \Delta. \tag{10}$$

The operator $I_{a,b,c}$ is a natural extension of several operators such as Alexander, Libera, Bernardi, and Carlson-Shaffer operators denoted, respectively, by \mathcal{A} , \mathfrak{L} , \mathfrak{B} , and $\mathfrak{L}(a, c)$.

Motivated by the work of Thulasiram et al. [9], in this paper, by applying the linear operator $I_{a,b,c}$, we establish some interesting connections between the class $SD(\alpha)$ and the classes ST and $R_\eta(\beta)$, ($\beta < 1$) consisting of functions f given

by (1). Also we consider an integral operator related to the hypergeometric functions.

2. Main Results

In the sequel the function $f \in A$ is given by (1).

Theorem 2. *Let $a, b \in C \setminus \{0\}$. Also let c be a real number such that $c > |a| + |b| + 2$. If $f \in ST$ and if the inequality*

$$\frac{\Gamma(c) \Gamma(c - |a| - |b|)}{\Gamma(c - |a|) \Gamma(c - |b|)} \left[\frac{|ab|}{(c - |a| - |b| - 1)} \left(\frac{\alpha (|a| + 1) (|b| + 1)}{(c - |a| - |b| - 2)} + 2\alpha + 1 \right) + 1 \right] \leq 2 \tag{11}$$

is satisfied, then $I_{a,b,c}(f) \in SD(\alpha)$.

Proof. Let $f \in ST$. Applying the well-known estimate due to Nevanlinna [10] for the coefficients of the functions $f \in ST$, in view of Theorem 1, we need to prove that

$$\sum_{n=2}^{\infty} n(1 + \alpha(n - 1)) \left| \frac{(a)_{n-1} (b)_{n-1}}{(c)_{n-1} (1)_{n-1}} \right| \leq 1. \tag{12}$$

By virtue of the relation $|(d)_n| \leq (|d|)_n$, and on writing $n + 2 = (n + 1) + 1$ and $(n + 2)^2 = (n + 1)^2 + 2(n + 1) + 1$ and using the fact that $(a)_{n+k} = (a)_k (a + k)_n$, we have

$$\begin{aligned} \sum_{n=2}^{\infty} n(1 + \alpha(n - 1)) \left| \frac{(a)_{n-1} (b)_{n-1}}{(c)_{n-1} (1)_{n-1}} \right| &\leq \sum_{n=2}^{\infty} n(1 + \alpha(n - 1)) \frac{(|a|)_{n-1} (|b|)_{n-1}}{(c)_{n-1} (1)_{n-1}} \\ &= \sum_{n=1}^{\infty} \{ (n + 1) + \alpha [(n + 1)^2 - (n + 1)] \} \frac{(|a|)_n (|b|)_n}{(c)_n (1)_n} \\ &= \alpha \sum_{n=0}^{\infty} (n + 2)^2 \frac{(|a|)_{n+1} (|b|)_{n+1}}{(c)_{n+1} (1)_{n+1}} + (1 - \alpha) \sum_{n=0}^{\infty} (n + 2) \frac{(|a|)_{n+1} (|b|)_{n+1}}{(c)_{n+1} (1)_{n+1}} \\ &= \alpha \sum_{n=0}^{\infty} \frac{(n + 1)^2 (|a|)_{n+1} (|b|)_{n+1}}{(c)_{n+1} (1)_{n+1}} + 2\alpha \sum_{n=0}^{\infty} \frac{(n + 1) (|a|)_{n+1} (|b|)_{n+1}}{(c)_{n+1} (1)_{n+1}} \\ &\quad + (1 - \alpha) \sum_{n=0}^{\infty} (n + 1) \frac{(|a|)_{n+1} (|b|)_{n+1}}{(c)_{n+1} (1)_{n+1}} + \sum_{n=0}^{\infty} \frac{(|a|)_{n+1} (|b|)_{n+1}}{(c)_{n+1} (1)_{n+1}} \\ &= \alpha \sum_{n=0}^{\infty} \frac{(|a|)_{n+2} (|b|)_{n+2}}{(c)_{n+2} (1)_n} + [2\alpha + 1] \sum_{n=0}^{\infty} \frac{(|a|)_{n+1} (|b|)_{n+1}}{(c)_{n+1} (1)_n} + \sum_{n=0}^{\infty} \frac{(|a|)_n (|b|)_n}{(c)_n (1)_n} - 1 \\ &= \frac{\alpha (|a|)_2 (|b|)_2}{(c)_2} \sum_{n=0}^{\infty} \frac{(|a| + 2)_n (|b| + 2)_n}{(c + 2)_n (1)_n} + (2\alpha + 1) \frac{|ab|}{c} \sum_{n=0}^{\infty} \frac{(|a| + 1)_n (|b| + 1)_n}{(c + 1)_n (1)_n} \\ &\quad + \sum_{n=0}^{\infty} \frac{(|a|)_n (|b|)_n}{(c)_n (1)_n} - 1 \\ &= \frac{\alpha (|a|)_2 (|b|)_2}{(c)_2} \frac{\Gamma(c + 2) \Gamma(c - |a| - |b| - 2)}{\Gamma(c - |a|) \Gamma(c - |b|)} \end{aligned}$$

$$\begin{aligned}
 & + (2\alpha + 1) \frac{|ab| \Gamma(c + 1) \Gamma(c - |a| - |b| - 1)}{c \Gamma(c - |a|) \Gamma(c - |b|)} + \frac{\Gamma(c) \Gamma(c - |a| - |b|)}{\Gamma(c - |a|) \Gamma(c - |b|)} - 1 \\
 & = \frac{\Gamma(c) \Gamma(c - |a| - |b|)}{\Gamma(c - |a|) \Gamma(c - |b|)} \left\{ \frac{|ab|}{(c - |a| - |b| - 1)} \left[\frac{\alpha(|a| + 1)(|b| + 1)}{(c - |a| - |b| - 2)} + 2\alpha + 1 \right] + 1 \right\} - 1 \\
 & \leq 1,
 \end{aligned} \tag{13}$$

which is satisfied by the hypothesis. \square

On setting $b = \bar{a}$, an improvement of the assertion of Theorem 2 is obtained as given in Theorem 3.

Theorem 3. Let $a \in \mathbb{C} \setminus \{0\}$. Also let c be a real number such that $c > \max\{0, 2 \operatorname{Re}(a) + 2\}$. If $f \in ST$, and if the inequality

$$\begin{aligned}
 & \frac{\Gamma(c) \Gamma(c - 2 \operatorname{Re}(a))}{\Gamma(c - a) \Gamma(c - \bar{a})} \left\{ \frac{|a|^2}{(c - 2 \operatorname{Re}(a) - 1)} \left[\frac{\alpha(a + 1)(\bar{a} + 1)}{c - 2 \operatorname{Re}(a) - 2} \right. \right. \\
 & \left. \left. + 2\alpha + 1 \right] + 1 \right\} \leq 2
 \end{aligned} \tag{14}$$

is satisfied, then $I_{a, \bar{a}, c}(f) \in SD(\alpha)$.

Theorem 4. Let $a, b \in \mathbb{C} \setminus \{0\}$. Also, let c be a real number such that $c > |a| + |b|$, $|a| \neq 1$, $|b| \neq 1$. If $f \in R_\eta(\beta)$, ($\beta < 1$) and the inequality

$$\begin{aligned}
 & \frac{2(1 - \beta) \cos \eta}{(|a| - 1)(|b| - 1)} \left[\frac{\Gamma(c) \Gamma(c - |a| - |b|)}{\Gamma(c - |a|) \Gamma(c - |b|)} [c - |a| - |b| \right. \\
 & \left. + \alpha(|ab| + 1 - c)] - [c + |ab| - |a| - |b| \right. \\
 & \left. - \alpha(c - 1)] \right] \leq 1
 \end{aligned} \tag{15}$$

is satisfied, then $I_{a, b, c}(f) \in SD(\alpha)$.

Proof. Let f be of the form (1) and let $f \in R_\eta(\beta)$, ($\beta < 1$). By virtue of Theorem 1 and in view of (10), it remains to show that

$$\sum_{n=2}^{\infty} (1 + \alpha(n - 1)) \left| \frac{(a)_{n-1} (b)_{n-1}}{(c)_{n-1} (1)_{n-1}} a_n \right| \leq 1. \tag{16}$$

Using the inequality (4) and the relations $(d)_n = d(d + 1)_{n-1}$ and $|(d)_n| \leq (|d|)_n$, we obtain that

$$\begin{aligned}
 & \sum_{n=2}^{\infty} (1 + \alpha(n - 1)) \left| \frac{(a)_{n-1} (b)_{n-1}}{(c)_{n-1} (1)_{n-1}} a_n \right| \leq 2(1 - \beta) \\
 & \cdot \cos \eta \sum_{n=2}^{\infty} \frac{(1 + \alpha(n - 1))}{n} \frac{(|a|)_{n-1} (|b|)_{n-1}}{(c)_{n-1} (1)_{n-1}} = 2\alpha(1 - \beta) \\
 & \cdot \cos \eta \sum_{n=2}^{\infty} \frac{(|a|)_{n-1} (|b|)_{n-1}}{(c)_{n-1} (1)_{n-1}} + 2(1 - \alpha)(1 - \beta) \\
 & \cdot \cos \eta \sum_{n=2}^{\infty} \frac{(|a|)_{n-1} (|b|)_{n-1}}{(c)_{n-1} (1)_{n-1}} = 2\alpha(1 - \beta) \cos \eta \sum_{n=1}^{\infty} \frac{(|a|)_n (|b|)_n}{(c)_n (1)_n}
 \end{aligned}$$

$$\begin{aligned}
 & + 2(1 - \alpha)(1 - \beta) \\
 & \cdot \cos \eta \sum_{n=2}^{\infty} \frac{((|a| - 1)_n / (|a| - 1)) ((|b| - 1)_n / (|b| - 1))}{((c - 1)_n / (c - 1)) (1)_n} = 2\alpha(1 - \beta) \\
 & - \beta) \cos \eta \left[\sum_{n=0}^{\infty} \frac{(|a|)_n (|b|)_n}{(c)_n (1)_n} - 1 \right] \\
 & + \frac{2(1 - \alpha)(1 - \beta)(c - 1) \cos \eta}{(|a| - 1)(|b| - 1)} \left[\sum_{n=0}^{\infty} \frac{(|a| - 1)_n (|b| - 1)_n}{(c - 1)_n (1)_n} - 1 \right. \\
 & \left. - \frac{(|a| - 1)(|b| - 1)}{(c - 1)} \right] = 2\alpha(1 - \beta) \cos \eta \left[\frac{\Gamma(c) \Gamma(c - |a| - |b|)}{\Gamma(c - |a|) \Gamma(c - |b|)} \right. \\
 & \left. - 1 \right] \\
 & + \frac{2(1 - \alpha)(1 - \beta)(c - 1) \cos \eta}{(|a| - 1)(|b| - 1)} \left[\frac{\Gamma(c - 1) \Gamma(c - |a| - |b| + 1)}{\Gamma(c - |a|) \Gamma(c - |b|)} \right. \\
 & \left. - 1 - \frac{(|a| - 1)(|b| - 1)}{(c - 1)} \right] = 2\alpha(1 - \beta) \cos \eta \\
 & \cdot \left[\frac{\Gamma(c) \Gamma(c - |a| - |b|)}{\Gamma(c - |a|) \Gamma(c - |b|)} - 1 \right] \\
 & + \frac{2(1 - \alpha)(1 - \beta) \cos \eta}{(|a| - 1)(|b| - 1)} \left[\frac{\Gamma(c) \Gamma(c - |a| - |b|) \cdot (c - |a| - |b|)}{\Gamma(c - |a|) \Gamma(c - |b|)} \right. \\
 & \left. - (c - 1) - (|a| - 1)(|b| - 1) \right] = 2(1 - \beta) \cos \eta \\
 & \cdot \frac{\Gamma(c) \Gamma(c - |a| - |b|)}{\Gamma(c - |a|) \Gamma(c - |b|)} \left[\alpha + \frac{(1 - \alpha)(c - |a| - |b|)}{(|a| - 1)(|b| - 1)} \right] + 2(1 - \beta) \\
 & - \beta) \cos \eta \left[-\alpha - \frac{(1 - \alpha)(c - 1)}{(|a| - 1)(|b| - 1)} - (1 - \alpha) \right] \\
 & = \frac{2(1 - \beta) \cos \eta}{(|a| - 1)(|b| - 1)} \left[\frac{\Gamma(c) \Gamma(c - |a| - |b|)}{\Gamma(c - |a|) \Gamma(c - |b|)} [c - |a| - |b| \right. \\
 & \left. + \alpha(|ab| + 1 - c)] - [c + |ab| - |a| - |b| - \alpha(c - 1)] \right] \leq 1.
 \end{aligned} \tag{17}$$

\square

On taking $b = \bar{a}$, an improvement of the assertion of Theorem 4 is obtained as given in Theorem 5.

Theorem 5. Let $a \in \mathbb{C} \setminus \{0\}$. Further let c be a real number such that $c > \max\{0, 2 \operatorname{Re}(a)\}$, $a \neq 1$. If $f \in R_\eta(\beta)$, ($\beta < 1$) and the inequality

$$\frac{2(1 - \beta) \cos \eta}{(a - 1)(\bar{a} - 1)} \left[\frac{\Gamma(c) \Gamma(c - 2 \operatorname{Re}(a))}{\Gamma(c - a) \Gamma(c - \bar{a})} [c - 2 \operatorname{Re}(a) \right.$$

$$\begin{aligned}
 & + \alpha (|a|^2 + 1 - c) - [c - |a|^2 - 2 \operatorname{Re}(a) \\
 & - \alpha (c - 1)] \leq 1
 \end{aligned}
 \tag{18}$$

is satisfied, then $I_{a,\bar{a},c}(f) \in SD(\alpha)$.

3. An Integral Operator

We now obtain results in connection with a particular integral operator [11] $G(a, b; c; z)$ defined by

$$G(a, b; c; z) = \int_0^z F(a, b; c; t) dt, \tag{19}$$

where $F(a, b; c; z) = {}_2F_1(z)$ is given by (5).

Theorem 6. Let $a, b \in C - \{0\}$. Also let c be a real number such that $c > |a| + |b|$, $|a| \neq 1$, $|b| \neq 1$. Let $G(a, b; c; z)$ be given by (19). If the hypergeometric inequality

$$\begin{aligned}
 & \frac{\Gamma(c) \Gamma(c - |a| - |b|)}{\Gamma(c - |a|) \Gamma(c - |b|)} \left[\frac{c(1 - \alpha) + \alpha(|ab| + 1) - (|a| + |b|)}{(|a| - 1)(|b| - 1)} \right] \\
 & - \frac{(1 - \alpha)(c - 1)}{(|a| - 1)(|b| - 1)} \leq 2
 \end{aligned}
 \tag{20}$$

is satisfied, then $G(a, b, c, z) \in SD(\alpha)$.

Proof. The function $G(a, b; c; z)$ has the series representation given by

$$z + \sum_{n=2}^{\infty} \frac{(a)_{n-1} (b)_{n-1}}{(c)_{n-1} (1)_n} z^n. \tag{21}$$

In view of Theorem 1, it is enough to prove that

$$\sum_{n=2}^{\infty} [1 + \alpha(n - 1)] \left| \frac{(a)_{n-1} (b)_{n-1}}{(c)_{n-1} (1)_n} \right| \leq 1. \tag{22}$$

Now

$$\begin{aligned}
 & \sum_{n=2}^{\infty} [1 + \alpha(n - 1)] \left| \frac{(a)_{n-1} (b)_{n-1}}{(c)_{n-1} (1)_n} \right| \leq (1 - \alpha) \\
 & \cdot \sum_{n=2}^{\infty} \frac{(|a|)_{n-1} (|b|)_{n-1}}{(c)_{n-1} (1)_n} + \alpha \sum_{n=2}^{\infty} \frac{n (|a|)_{n-1} (|b|)_{n-1}}{(c)_{n-1} (1)_n} = (1 \\
 & - \alpha) \sum_{n=2}^{\infty} \frac{(|a| - 1)_n (|b| - 1)_n (c - 1)}{(|a| - 1) (|b| - 1) (c - 1)_n (1)_n} \\
 & + \alpha \sum_{n=2}^{\infty} \frac{(|a|)_{n-1} (|b|)_{n-1}}{(c)_{n-1} (1)_{n-1}} \\
 & = \frac{(1 - \alpha)(c - 1)}{(|a| - 1) (|b| - 1)} \left[\sum_{n=0}^{\infty} \frac{(|a| - 1)_n (|b| - 1)_n}{(c - 1)_n (1)_n} - 1 \right. \\
 & \left. - \frac{(|a| - 1) (|b| - 1)}{c - 1} \right] + \alpha \left[\sum_{n=1}^{\infty} \frac{(|a|)_n (|b|)_n}{(c)_n (1)_n} \right]
 \end{aligned}$$

$$\begin{aligned}
 & = \frac{\Gamma(c) \Gamma(c - |a| - |b|)}{\Gamma(c - |a|) \Gamma(c - |b|)} \left[\frac{(1 - \alpha)(c - |a| - |b|)}{(|a| - 1) (|b| - 1)} \right. \\
 & \left. + \alpha \right] - \frac{(1 - \alpha)(c - 1)}{(|a| - 1) (|b| - 1)} - 1 \leq 1,
 \end{aligned}
 \tag{23}$$

(23)

by hypothesis. □

A result analogous to Theorem 6 can be stated for the class $UCD(\alpha)$ in Theorem 7.

Theorem 7. Let $a, b \in C - \{0\}$. Also let c be a real number such that $c > |a| + |b| + 1$. Let $f \in A$ and be of the form (1). If the hypergeometric inequality

$$\begin{aligned}
 & \frac{\Gamma(c) \Gamma(c - |a| - |b| - 1)}{\Gamma(c - |a|) \Gamma(c - |b|)} [c - |a| - |b| + \alpha|ab| - 1] \\
 & \leq 2
 \end{aligned}
 \tag{24}$$

is satisfied, then $G(a, b, c, z) \in UCD(\alpha)$.
