For a normalized analytic function f defined on the unit disc \mathbb{D} , let $\phi(f, f', f''; z)$ be a function of positive real part in \mathbb{D} , $\psi(f, f', f''; z)$ need not have that property in \mathbb{D} , and $\chi = \phi + \psi$. For certain choices of ϕ and ψ , a sharp radius constant ρ is determined, $0 < \rho < 1$, so that $\chi(\rho z)/\rho$ maps \mathbb{D} onto a specified region in the right half-plane.

1. Introduction

Let \mathscr{A} be the class of functions f analytic in $\mathbb{D} = \{z \in \mathbb{C} : |z| < 1\}$ and normalized by f(0) = 0 = f'(0) - 1. Let \mathscr{S} be its subclass consisting of univalent functions. For two analytic functions f and g, the function f is subordinate to g, written f(z) < g(z), if there is an analytic selfmap $w : \mathbb{D} \to \mathbb{D}$ with w(0) = 0 satisfying f(z) = g(w(z)). Given an analytic function p with p(0) = 1 and Re p(z) > 0in \mathbb{D} , denote by $\mathscr{ST}(p)$ and $\mathscr{CV}(p)$ the subclasses of \mathscr{A} consisting, respectively, of f satisfying zf'(z)/f(z) < p(z).

For various choices of p, these classes reduce to wellknown subclasses of starlike and convex functions. For instance, with $p(z) = (1 + (1 - 2\alpha)z)/(1 - z), 0 \le \alpha <$ 1, then $\mathcal{ST}(\alpha)$ and $\mathcal{CV}(\alpha)$ are, respectively, the subclasses consisting of *starlike functions of order* α and *convex functions of order* α . The classes $\mathcal{ST} := \mathcal{ST}(0)$ and $\mathcal{CV} :=$ $\mathcal{CV}(0)$ are the familiar subclasses of \mathcal{S} of starlike and convex functions. For $p(z) = (1 + (1 - 2\beta)z)/(1 - z), \beta > 1$, $\mathcal{M}(\beta) = \mathcal{ST}(p)$ is the class of functions $f \in \mathcal{A}$ satisfying

$$\mathcal{M}(\beta) := \left\{ f \in \mathcal{A} : \operatorname{Re}\left(\frac{zf'(z)}{f(z)}\right) < \beta \ (z \in \mathbb{D}) \right\} \quad (1)$$

studied by Uralegaddi et al. [1]. Various subclasses of $\mathcal{M}(\beta)$ have been investigated in [2–5]. For p(z) =

 $((1+z)/(1-z))^{\alpha}$, $0 < \gamma \le 1$, the class $\mathcal{SST}(\gamma) := \mathcal{ST}(p)$ is the class of *strongly starlike functions of order* γ . The class $\mathcal{S}_{\mathscr{L}} := \mathcal{ST}(\sqrt{1+z})$ introduced by Sokół and Stankiewicz [6] consists of functions $f \in \mathscr{A}$ satisfying

$$\left| \left(\frac{zf'(z)}{f(z)} \right)^2 - 1 \right| < 1 \quad (z \in \mathbb{D}).$$
 (2)

Thus, a function $f \in \mathcal{A}$ is in the class $\mathcal{S}_{\mathcal{L}}$ if zf'(z)/f(z) lies in the region bounded by the right-half of the lemniscate of Bernoulli given by $|w^2 - 1| < 1$. Results related to the class $\mathcal{S}_{\mathcal{L}}$ can be found in [3, 7–9].

In investigating the class \mathscr{UCV} of uniformly convex functions, Rønning [10] introduced a class $\mathscr{S}_{\mathscr{P}}$ of *parabolic starlike functions*. These are functions $f \in \mathscr{A}$ satisfying

$$\operatorname{Re}\left(\frac{zf'(z)}{f(z)}\right) > \left|\frac{zf'(z)}{f(z)} - 1\right| \quad (z \in \mathbb{D}).$$
(3)

It is important to keep in mind that the qualifier "parabolic" refers to the geometry of the image of \mathbb{D} under the map zf'(z)/f(z); that is, the domain necessarily lies in a parabolic region of the *w*-plane. It does not convey the interpretation that the function f maps the disk \mathbb{D} onto a parabolic region. This terminology of *parabolic starlike functions* is however widely accepted and used by authors. Ali

and Ravichandran [11] recently surveyed works on uniformly convex and *parabolic starlike functions*.

This paper finds radius estimates for classes of functions in \mathscr{A} . The radius of a property P in a given set of functions \mathscr{M} [12, page 119] is the largest number R such that every function in the set \mathscr{M} has the property P in each disc $\mathbb{D}_r = \{z \in \mathbb{C} : |z| < r\}$ for every r < R. For example, the Koebe function $k(z) = z/(1-z)^2$, which maps \mathbb{D} onto the domain $\mathbb{C} \setminus \{w \in \mathbb{R} : w \leq -1/4\}$, is starlike but not convex. However, k maps the disc \mathbb{D}_r onto a convex domain for every $r \leq 2 - \sqrt{3}$. Indeed, every univalent function $f \in$ \mathscr{S} maps \mathbb{D}_r onto a convex domain for $r \leq 2 - \sqrt{3}$ [13, Theorem 2.13, page 44]. This number is known as the radius of convexity for \mathscr{S} .

It is known that $\mathscr{CV} \subseteq \mathscr{ST}(1/2) \subseteq \{f \in \mathscr{A} : \operatorname{Re}(f(z)/z) > 1/2, z \in \mathbb{D}\}$. The function g(z) = z/(1-z) is convex and therefore starlike of order 1/2; it is clear that the function

$$\phi(z) \coloneqq \frac{zg'(z)}{g(z)} \tag{4}$$

has real part greater than 1/2. Now the function

$$\psi(z) \coloneqq \frac{z^2 g''(z)}{g(z)}$$
(5)

takes values in $\mathbb{C} \setminus \{w \in \mathbb{R} : w \leq -1/2\}$, and therefore does not have positive real part for all $z \in \mathbb{D}$. Their sum

$$\phi(z) + \psi(z) = \frac{zg'(z)}{g(z)} + \frac{z^2g''(z)}{g(z)}$$

$$= \frac{zg'(z)}{g(z)} \left(1 + \frac{zg''(z)}{g'(z)}\right)$$
(6)

takes values in $\{w := x + iy \in \mathbb{C} : y^2 > -x/2\}$ and therefore the sum $\phi + \psi$ does not have positive real part in \mathbb{D} . This motivates us to determine the largest radius ρ such that

$$\operatorname{Re}\left(\frac{z^{2}g''(z)}{g(z)} + \frac{zg'(z)}{g(z)}\right) > \alpha \quad \left(|z| \le \rho\right).$$
(7)

More generally, let $\phi = \phi(f, f', f''; z)$ and $\psi = \psi(f, f', f''; z)$ be functions satisfying $\operatorname{Re} \phi > 0$ in \mathbb{D} , while $\operatorname{Re} \psi$ need not necessarily be positive in the whole unit disc \mathbb{D} . For certain choices of ϕ and ψ , a sharp radius constant ρ is determined, $0 \leq \rho < 1$, so that whenever $|z| < \rho$, the sum $\phi + \psi$ takes values in specified regions in the complex plane. The results obtained are shown to reduce those of Singh and Paul [14] in certain special cases.

2. Main Results

For $\phi(z) := \phi(f, f', f''; z) = zf'(z)/f(z)$ and $\psi(z) := \psi(f, f', f''; z) = z^2 f''(z)/f(z)$, with $f \in S\mathcal{T}(1/2)$, several radius results for the sum $\phi + \psi$ to be in certain regions in the complex plane are obtained in the following result.

Theorem 1. Let $f \in S\mathcal{T}(1/2)$; let $\chi : \mathbb{D} \to \mathbb{C}$ be defined by

$$\chi(z) = \frac{z^2 f''(z)}{f(z)} + \frac{z f'(z)}{f(z)},$$

$$\chi_i(z) = \chi(\rho_i z), \quad i = 1, 2, \dots, 6.$$
(8)

Then

(a) Re $\chi_1(z) > \alpha$, $0 \le \alpha < 1$, where ρ_1 is given by

$$\rho_{1} = \begin{cases}
\sqrt{\frac{7 - 16\alpha}{11 - 16\alpha + 8\sqrt{2 - 4\alpha}}}, & 0 \le \alpha \le \frac{2 + \sqrt{13}}{18} \\
\frac{2(1 - \alpha)}{1 + 2\alpha + \sqrt{1 + 8\alpha}}, & \frac{2 + \sqrt{13}}{18} < \alpha < 1.
\end{cases} (9)$$

(b) $|\chi_2^2(z) - 1| < 1$, where ρ_2 is given by

$$\rho_2 = \frac{2\left(\sqrt{2} - 1\right)}{1 + 2\sqrt{2} + \sqrt{1 + 8\sqrt{2}}} \approx 0.112903.$$
(10)

(c) Re $\chi_3(z) < \beta$, $\beta > 1$, where ρ_3 is given by

$$\rho_3 = \frac{2(\beta - 1)}{1 + 2\beta + \sqrt{1 + 8\beta}}.$$
(11)

(d) $|\chi_4(z) - 1| < 1 - \alpha, \ 0 \le \alpha < 1$, where ρ_4 is given by

$$\rho_4 = \frac{2(1-\alpha)}{5-2\alpha + \sqrt{17-8\alpha}}.$$
(12)

(e) $|\arg(\chi_5(z))| < \gamma \pi/2, \ 0 < \gamma \le 1$ where $\rho_5 = \rho_5(\gamma) \in (0, 1)$ is the root of the equation in r:

$$\left(1 + 2\left(1 - r^2\right)t_0\right)\sqrt{4t_0 - \left(1 + t_0 - r^2t_0\right)^2} - \left(1 + t_0\left(-1 - 3r^2 + 2\left(1 - r^2\right)^2t_0\right)\right)\tan\left(\frac{\pi\gamma}{2}\right) = 0,$$

$$t_0 = \frac{5 - r^2 + \sqrt{9 - 10r^2 + 17r^4}}{8\left(1 - r^4\right)}.$$

$$(13)$$

In particular,

$$\rho_5\left(\frac{1}{4}\right) \simeq 0.131522, \qquad \rho_5\left(\frac{1}{2}\right) \simeq 0.266747,$$
(14)
 $\rho_5\left(\frac{3}{4}\right) \simeq 0.409049, \qquad \rho_5(1) \simeq 0.560097.$

(f) Also $|\chi_6(z) - 1| < \text{Re } \chi_6(z)$, where $\rho_6 \approx 0.23605 \in (0, 1)$ is the root of the following equation in r:

$$2(1+9r^{2})t_{0} - 1 + (-5+26r^{2}-21r^{4})t_{0}^{2} + 4(1-r^{2})^{2}(1+3r^{2})t_{0}^{3} - 4(1-r^{2})^{4}t_{0}^{4} = 0,$$
(15)

and $t_0 \in (1/(1 + r)^2, 1/(1 - r)^2)$ is the root of the equation in t:

$$2(1+9r^{2})+2(-5+26r^{2}-21r^{4})t + 12(1-r^{2})^{2}(1+3r^{2})t^{2}-16(1-r^{2})^{4}t^{3}=0.$$
(16)

Each radius constant ρ_i is sharp.

For two analytic functions $f, g \in \mathcal{A}$, their *convolution* or *Hadamard product*, denoted by f * g, is defined by $(f * g)(z) := z + \sum_{n=2}^{\infty} a_n b_n z^n$. The following results are needed in the sequel.

Lemma 2 ([15, Lemma 2.7, page 126; Lemma 3.5, page 130]). If $f \in CV$ and $g \in ST$, or f and g belong to ST(1/2), then

$$\frac{f * gF}{f * g} (\mathbb{D}) \subset \overline{\operatorname{co}} (F (\mathbb{D}))$$
(17)

for any function F analytic in \mathbb{D} , where $\overline{co}(F(\mathbb{D}))$ denotes the closed convex hull of $F(\mathbb{D})$.

Lemma 3 ([7, Lemma 2.2, page 6559]). For $0 < a < \sqrt{2}$, let r_a be given by

$$r_{a} = \begin{cases} \left(\sqrt{1-a^{2}} - \left(1-a^{2}\right)\right)^{1/2}, & 0 < a \le 2\sqrt{2}/3 \\ \sqrt{2} - a, & 2\sqrt{2}/3 \le a < \sqrt{2}, \end{cases}$$
(18)

and for a > 0, let R_a be given by

$$R_{a} = \begin{cases} \sqrt{2} - a, & 0 < a \le \frac{1}{\sqrt{2}}, \\ a, & \frac{1}{\sqrt{2}} \le a. \end{cases}$$
(19)

Then,

$$\{ w : |w - a| < r_a \} \subseteq \{ w : |w^2 - 1| < 1 \}$$

$$\subseteq \{ w : |w - a| < R_a \}.$$
(20)

Proof of Theorem 1. Let $h : \mathbb{D} \to \mathbb{C}$ be defined by

$$h(z) = \frac{2}{(1-z)^2} - \frac{1}{1-z}.$$
(21)

First, for each $i = 1, 2, ..., 6, h_i(z) = h(\rho_i z)$ will be shown to, respectively, satisfy Re $h_1(z) > \alpha$, $|h_2(z) - 1| < 1$, Re $h_3(z) < \beta$, $|h_4(z) - 1| < 1 - \alpha$, $|\arg h_5(z)| < \gamma \pi/2$, and $|h_6(z) - 1| < \text{Re } h_6(z)$. Then, using Lemma 2, χ_i is deduced to satisfy the required condition.

As in [14], let

$$\frac{1}{1-z} = Re^{i\theta},\tag{22}$$

so that

$$\frac{1}{1+r} \le R \le \frac{1}{1-r} \quad (|z|=r),$$

$$\cos\theta = \frac{1+R^2 - r^2 R^2}{2R}.$$
(23)

(a) By (21), (22), and (23), it follows that
Re
$$h(z) = 2R^2 \cos 2\theta - R \cos \theta$$

 $= \frac{1}{2} - \frac{1}{2} (1 + 3r^2) t + (1 - r^2)^2 t^2 \quad (t := R^2)$
 $=: \phi(t).$
(24)

Case (*i*). Suppose that $0 \le \alpha \le (2 + \sqrt{13})/18$. We assert that $\min \phi(t) > \alpha$ for $|z| < \rho_1$, where the minimum is taken over all $t \in (1/(1+r)^2, 1/(1-r)^2)$. Let $r < \rho_1$. Then

$$\frac{\partial \phi(t)}{\partial t} = -\frac{1}{2} \left(1 + 3r^2 \right) + 2 \left(1 - r^2 \right)^2 t = 0$$
 (25)

if $t = t_0 := (1 + 3r^2)/(4(1 - r^2)^2)$, $\partial^2 \phi(t_0)/\partial t^2 > 0$, and that for $r \ge 4 - \sqrt{13}$,

$$\frac{1}{\left(1+r\right)^{2}} \le t_{0} \le \frac{1}{\left(1-r\right)^{2}}.$$
(26)

Thus, for $4 - \sqrt{13} \le r < \rho_1$,

$$\min \phi(t) = \phi(t_0) = \frac{7 - 22r^2 - r^4}{16(1 - r^2)^2} > \alpha.$$
(27)

On the other hand, if $r < 4 - \sqrt{13}$, then it can be shown that

$$\min \phi(t) = \phi\left(\frac{1}{(1+r)^2}\right)$$
$$= \frac{1-r}{(1+r)^2} > \frac{\sqrt{13}-3}{\left(5-\sqrt{13}\right)^2}$$
(28)
$$= \frac{2+\sqrt{13}}{18} > \alpha.$$

Case (ii). For $(2 + \sqrt{13})/18 < \alpha < 1$, then min $\phi(t) > \alpha$ in $|z| < \rho_1$, $t \in (1/(1 + r)^2, 1/(1 - r)^2)$. Indeed for $r < \rho_1 < 4 - \sqrt{13}$, as in the case (i),

$$\min \phi(t) = \phi\left(\frac{1}{(1+r)^2}\right) = \frac{1-r}{(1+r)^2} > \alpha.$$
 (29)

The previously mentioned two cases show that Re $h_1(z) > \alpha$ in \mathbb{D} . Figure 1 illustrates sharpness of the radius $\rho_1 = \sqrt{5} - 2$ in the case $\alpha = 0.5$.

(b) For h given by (21), a calculation shows that

$$|h(z) - 1| = \left| \frac{2}{(1-z)^2} - \frac{1}{1-z} - 1 \right|$$

= $\left| \frac{z}{1-z} + \frac{2z}{(1-z)^2} \right|$ (30)
 $\leq \frac{r}{1-r} + \frac{2r}{(1-r)^2}.$

FIGURE 1: Image of $|z| \le \sqrt{5} - 2$ touches Re w = 0.5.

By Lemma 3, the function h satisfies

$$h^{2}(z) - 1 < 1$$
 (31)

provided

$$\frac{r}{1-r} + \frac{2r}{\left(1-r\right)^2} \le \sqrt{2} - 1;$$
(32)

that is,

$$\sqrt{2}r^2 - (1 + 2\sqrt{2})r + (\sqrt{2} - 1) \ge 0.$$
 (33)

This inequality holds if $r \le \rho_2$. Figure 2 illustrates sharpness of the radius $\rho_2 \simeq 0.1129$.

(c) From (30), it follows that

Re
$$h(z) \le 1 + \frac{r}{1-r} + \frac{2r}{(1-r)^2} \le \beta$$
 (34)

provided

$$\beta r^{2} - (1 + 2\beta) r - (1 - \beta) \ge 0$$
(35)

holds, which occurs whenever $r \le \rho_3$. Sharpness of the radius $\rho_3 = (4 - \sqrt{13})/3$ in the case $\beta = 1.5$ is illustrated in Figure 3.

(d) Inequality (30) also yields

$$|h(z) - 1| \le \frac{r}{1 - r} + \frac{2r}{(1 - r)^2} \le 1 - \alpha$$
(36)

provided

$$r^{2}(\alpha - 2) + r(5 - 2\alpha) + \alpha - 1 \le 0,$$
(37)

that is, when $r \le \rho_4$. Figure 4 illustrates sharpness of the radius $\rho_4 = (4 - \sqrt{13})/3$ in the case $\alpha = 0.5$.

FIGURE 2: Image of $|z| \le 0.1129$ touches $|w^2 - 1| = 1$.

(e) For the function h given by (21), it follows from (22) and (23) that

20

$$\arg h(z)$$

$$= \arctan\left(\frac{2R\sin 2\theta - \sin \theta}{2R\cos 2\theta - \cos \theta}\right)$$

= $\arctan\left(\frac{(4R\cos \theta - 1)\sin \theta}{2R(2\cos^2 \theta - 1) - \cos \theta}\right)$
= $\arctan\left(\frac{(1 + 2(1 - r^2)R^2)\sqrt{4R^2 - (1 + (1 - r^2)R^2)^2}}{1 - (1 + 3r^2)R^2 + 2(1 - r^2)^2R^4}\right)$
= $\arctan\left(\frac{(1 + 2(1 - r^2)t)\sqrt{4t - (1 + (1 - r^2)t)^2}}{1 - (1 + 3r^2)t + 2(1 - r^2)^2t^2}\right)$
:= $\arctan(\phi(t)),$ (38)

 $t \in (1/(1+r)^2, 1/(1-r)^2)$. A calculation shows that $\phi'(t) = 0$ where

$$t = t_0$$

= $\frac{5 - r^2 + \sqrt{9 - 10r^2 + 17r^4}}{8(1 - r^4)} \in \left(\frac{1}{(1 + r)^2}, \frac{1}{(1 - r)^2}\right).$
(39)

Now $\phi'(t) > 0$ for $t < t_0$, $\phi'(t) < 0$ if $t > t_0$, and

$$\phi\left(\frac{1}{(1+r)^2}\right) = \phi\left(\frac{1}{(1-r)^2}\right) = 0.$$
 (40)

Thus

 $\max\phi\left(t\right) = \phi\left(t_0\right)$

$$=\frac{\left(1+2\left(1-r^{2}\right)t_{0}\right)\sqrt{4t_{0}-\left(1+\left(1-r^{2}\right)t_{0}\right)^{2}}}{1-\left(1+3r^{2}\right)t_{0}+2\left(1-r^{2}\right)^{2}t_{0}^{2}}.$$
(41)

FIGURE 3: Image of $|z| \le (4 - \sqrt{13})/3$ touches Re w = 1.5.

$$\begin{aligned} \left| \arg h(z) \right| \\ \leq \left| \arctan \left(\frac{\left(1 + 2\left(1 - r^2 \right) t_0 \right) \sqrt{4t_0 - \left(1 + \left(1 - r^2 \right) t_0 \right)^2}}{1 - \left(1 + 3r^2 \right) t_0 + 2\left(1 - r^2 \right)^2 t_0^2} \right) \right| \\ \leq \frac{\gamma \pi}{2} \end{aligned}$$
(42)

provided

$$\left(1 + 2\left(1 - r^2\right)t_0\right)\sqrt{4t_0 - \left(1 + \left(1 - r^2\right)t_0\right)^2} - \left(1 + t_0\left(-1 - 3r^2 + 2\left(1 - r^2\right)^2t_0\right)\right)\tan\left(\frac{\pi\gamma}{2}\right)$$
(43)
 $\leq 0.$

Figure 5 illustrates sharpness of the radius $\rho_5\simeq 0.266747$ in the case $\gamma=0.5.$

(f) The inequality

$$|h(z) - 1| < \operatorname{Re} h(z) \tag{44}$$

holds if

$$(2R^2\cos 2\theta - R\cos \theta - 1)^2 + (2R^2\sin 2\theta - R\sin \theta)^2 < (2R^2\cos 2\theta - R\cos \theta)^2,$$
(45)

or, with $t = R^2$,

$$\phi(t) := 2(1+9r^2)t - 1 + (-5+26r^2 - 21r^4)t^2 + 4(1-r^2)^2(1+3r^2)t^3 - 4(1-r^2)^4t^4 < 0,$$
(46)

FIGURE 4: Image of $|z| \le (4 - \sqrt{13})/3$ touches |w - 1| = 0.5.

Figure 5: Image of $|z| \le 0.266747$ touches $|\arg w| = \pi/4$.

 $t \in (1/(1+r)^2, 1/(1-r)^2)$. Then,

$$\phi'(t) = 2(1+9r^{2}) + 2(-5+26r^{2}-21r^{4})t$$

$$+ 12(1-r^{2})^{2}(1+3r^{2})t^{2} - 16(1-r^{2})^{4}t^{3}.$$
(47)

FIGURE 6: Image of $|z| \le 0.23605$ touches |w - 1| = Re w.

Let $r < \rho_6$. Since

$$\phi'\left(\frac{1}{(1+r)^2}\right)$$

$$=\frac{4\left(-3+11r+6r^2+7r^3-r^4\right)}{(1+r)^2} > 0 \quad \text{if } r > 0.234722,$$

$$\phi'\left(\frac{1}{(1-r)^2}\right) = -\frac{4\left(3+11r-6r^2+7r^3+r^4\right)}{(1-r)^2} < 0,$$
(48)

there exists a unique $t_0 \in (1/(1+r)^2, 1/(1-r)^2)$ such that $\phi'(t_0) = 0$ and $\max \phi(t) = \phi(t_0)$.

Thus, $\max \phi(t) = \phi(t_0) < 0$ for 0.234722 < $r < \rho_6$. When $r \le 0.234722$,

$$\max\phi(t) = \phi\left(\frac{1}{(1+r)^2}\right) = \frac{4\left(4r - 1 + r^2\right)}{(1+r)^2} < 0; \quad (49)$$

hence, $\phi(t) < 0$ for $r < \rho_6$. Figure 6 illustrates sharpness of the radius $\rho_6 \simeq 0.23605$.

Next, consider $g_i(z) = z/(1-\rho_i z) \in \mathcal{CV} \subset \mathcal{ST}(1/2), i = 1, 2, \dots, 6$. Then,

$$\frac{f(z) * g_i(z) h_i(z)}{f(z) * g_i(z)}$$

=
$$\frac{f(z) * (z/(1 - \rho_i z)) (2\rho_i z/(1 - \rho_i z)^2 + 1/(1 - \rho_i z))}{f(z) * (z/(1 - \rho_i z))}$$

$$= \frac{f(z) * (2\rho_i z^2 / (1 - \rho_i z)^3 + z / (1 - \rho_i z)^2)}{f(z) * (z / (1 - \rho_i z))}$$

$$= \frac{\rho_i^2 z^2 f''(\rho_i z) + \rho_i z f'(\rho_i z)}{f(\rho_i z)}$$

$$= \chi(\rho_i z) = \chi_i(z).$$
 (50)

Lemma 2, together with (50) and the corresponding inequality for the function h_i , shows that each function χ_i satisfies the required condition. For sharpness, consider the function $f_0(z) = z/(1-z) \in \mathcal{CV} \subset \mathcal{ST}(1/2)$. Then,

$$\frac{z^2 f_0''(z) + z f_0'(z)}{f_0(z)} = \frac{2}{(1-z)^2} - \frac{1}{1-z} = h(z).$$
(51)

Sharpness of the numbers ρ_i is now evident in view of the definition *h*.

For $\alpha = 0$, Theorem 1(a) reduces to the following corollary.

Corollary 4 ([14, Theorem 5, page 724]). If $f \in S\mathcal{T}(1/2)$, then

$$\operatorname{Re}\left(\frac{z^{2}f''(z)}{f(z)} + \frac{zf'(z)}{f(z)}\right) > 0$$
(52)

in $|z| < \rho = \sqrt{8\sqrt{2} - 11} = 0.56$. The number ρ is sharp.

Theorem 5. Let $f \in S\mathcal{F}(1/2)$ and $\chi : \mathbb{D} \to \mathbb{C}$ be defined by

$$\chi(z) = \frac{f(z)}{z} + f'(z), \qquad \chi_i(z) = \chi(\rho_i z), \quad i = 1, 2, 3.$$
(53)

Then

(a) Re
$$\chi_1(z) > \alpha$$
, $0 \le \alpha < 1$, where ρ_1 is given by

$$\rho_{1} = \begin{cases}
\sqrt{\frac{7 - 8\alpha}{5 - 8\alpha + 4\sqrt{2}\sqrt{1 - \alpha}}}, & 0 \le \alpha < \frac{7 + 4\sqrt{7}}{18}, \\
\frac{4 - 2\alpha}{2\alpha - 1 + \sqrt{1 + 4\alpha}}, & \frac{7 + 4\sqrt{7}}{18} \le \alpha < 1.
\end{cases}$$
(54)

(b) $|\arg \chi_2(z)| < \gamma \pi/2, \ 0 < \gamma \le 1$, where $\rho_2 = \rho_2(\gamma) \in (0, 1)$ is the root of the equation

$$\left(\sqrt{9+5r^{2}\left(-2+r^{2}\right)}-2r^{2}\right)$$

$$\times\sqrt{16r^{2}+\left(3+3r^{2}-\sqrt{9+5r^{2}\left(r^{2}-2\right)}\right)^{2}}$$

$$+\left(\sqrt{9+5r^{2}\left(r^{2}-2\right)}-11-11r^{4}+5r^{2}\right)$$

$$\times\left(2+\sqrt{9+5r^{2}\left(r^{2}-2\right)}\right)\tan\left(\frac{\pi\gamma}{2}\right)=0.$$
(55)

In particular,

$$\rho_2\left(\frac{1}{4}\right) \simeq 0.257136, \qquad \rho_2\left(\frac{1}{2}\right) \simeq 0.487998,$$

$$\rho_2\left(\frac{3}{4}\right) \simeq 0.674274, \qquad \rho_2(1) = \sqrt{\frac{7}{5+4\sqrt{2}}} \simeq 0.810465.$$
(56)

(c) Also $|\chi_3(z) - 1| < \text{Re } \chi_3(z)$, where $\rho_3 \simeq 0.44915$ is given by the equation in r

$$24r^{2}t_{0} - 8 + (-1 + 18r^{2} - 17r^{4})t_{0}^{2} + 2(1 - r^{2})^{2}(-1 + 3r^{2})t_{0}^{3} - (1 - r^{2})^{4}t_{0}^{4} = 0$$
(57)

and t_0 is given by the equation in t

$$24r^{2} + 2\left(-1 + 18r^{2} - 17r^{4}\right)t + 6\left(1 - r^{2}\right)^{2}\left(-1 + 3r^{2}\right)t^{2} - 4\left(1 - r^{2}\right)^{4}t^{3} = 0.$$
(58)

Each radius constant ρ_i is sharp.

Proof. Let

$$h(z) = \frac{1}{1-z} + \frac{1}{(1-z)^2} \quad (z \in \mathbb{D}).$$
 (59)

Each $h_i(z) = h(\rho_i z)$, i = 1, 2, 3, is shown to, respectively, satisfy Re $h_1(z) > \alpha$, $|\arg h_2(z)| < \gamma \pi/2$, and $|h_3(z) - 1| < \text{Re } h_3(z)$. Then, it follows from Lemma 2 that χ_i satisfies the required condition.

(a) We claim that Re $h(z) > \alpha$ in $|z| < \rho_1$. By (22) and (23),

Re
$$h(z) = R \cos \theta + R^2 \cos 2\theta$$

= $1 + \frac{1}{2} \left(\left(1 - 3r^2 \right) t + \left(1 - r^2 \right)^2 t^2 \right) \quad (t := R^2)$
:= $\phi(t)$. (60)

Case (i). Suppose $0 \le \alpha < (7 + 4\sqrt{7})/18$. In this case, it is shown that $\min \phi(t) > \alpha$ for $|z| < \rho_1$ over all t in $(1/(1 + r)^2, 1/(1 - r)^2)$. Let $r < \rho_1$. It can be verified that

$$\frac{\partial \phi(t)}{\partial t} = \frac{1}{2} \left(1 - 3r^2 + 2\left(1 - r^2\right)^2 t \right) = 0$$
(61)

if $t = t_0 = (3r^2 - 1)/(2(1 - r^2)^2)$, $\partial^2 \phi(t_0)/\partial t^2 = (1 - r^2)^2 > 0$, and that for $r \ge \sqrt{7} - 2$,

$$\frac{1}{\left(1+r\right)^2} \le t_0 \le \frac{1}{\left(1-r\right)^2}.$$
(62)

Thus for $\sqrt{7} - 2 \le r < \rho_1$,

$$\min \phi(t) = \phi(t_0) = \frac{7 - 10r^2 - r^4}{8(1 - r^2)^2} > \alpha.$$
(63)

FIGURE 7: Image of $|z| \le \sqrt{3/5}$ touches Re w = 0.5.

On the other hand, if $r < \sqrt{7} - 2$, then

$$\min \phi(t) = \phi\left(\frac{1}{(1+r)^2}\right) = \frac{2+r}{(1+r)^2}.$$
 (64)

Since $g(r) = (2 + r)/(1 + r)^2$ is a decreasing function in $(0, \sqrt{7} - 2)$,

$$\min \phi(t) = \frac{(2+r)}{(1+r)^2} > \frac{2+\sqrt{7}-2}{\left(1+\sqrt{7}-2\right)^2}$$

$$= \frac{\sqrt{7}}{\left(\sqrt{7}-1\right)^2} = \frac{4\sqrt{7}+7}{18} > \alpha.$$
(65)

Case (ii). For $(7+4\sqrt{7})/18 \le \alpha < 1$, we prove that $\min \phi(t) > \alpha$ in $|z| < \rho_1$, $t \in (1/(1+r)^2, 1/(1-r)^2)$. Let $r < \rho_1 < \sqrt{7} - 2$. As in Case (i), then

$$\min \phi(t) = \phi\left(\frac{1}{(1+r)^2}\right) = \frac{(2+r)}{(1+r)^2} > \alpha.$$
 (66)

It is evident from the previous two cases that Re $h_1(z) > \alpha$ in \mathbb{D} . Figure 7 shows that, for $\alpha = 0.5$, the radius $\rho_1 = \sqrt{3/5}$ is sharp.

(b) Let $h(re^{it}) = u + iv$. Then,

$$u = \frac{2\left(1 + r^{2} + r^{2}\cos 2t\right) - r\left(5 + r^{2}\right)\cos t}{\left(1 + r^{2} - 2r\cos t\right)^{2}},$$

$$v = \frac{r\left(3 + r^{2} - 4r\cos t\right)\sin t}{\left(1 + r^{2} - 2r\cos t\right)^{2}}.$$
(67)

By (67), it follows that

$$\arg h(re^{it}) = \arctan\left(\frac{r(3+r^2-4r\cos t)\sin t}{2(1+r^2+r^2\cos 2t)-r(5+r^2)\cos t}\right).$$
(68)

Let $g: [-1, 1] \rightarrow \mathbb{R}$ be defined by

$$g(x) = \frac{r\left(3 + r^2 - 4rx\right)\sqrt{1 - x^2}}{2 - r\left(5 + r^2\right)x + 4r^2x^2}.$$
(69)

(The case $-\sqrt{1-x^2}$ is similar.) A calculation shows that

$$g'(x) = \frac{r\left(1+r^2-2rx\right)\left(r\left(7+r^2\right)-6x\left(1+r^2\right)+4rx^2\right)}{\sqrt{1-x^2}\left(2-r\left(5+r^2\right)x+4r^2x^2\right)^2}.$$
(70)

Let

$$x_0 = \frac{3 + 3r^2 - \sqrt{9 - 10r^2 + 5r^4}}{4r} \in (0, 1].$$
 (71)

Then, $g'(x_0) = 0$, g'(x) > 0 for $x < x_0$, and g'(x) < 0 for $x > x_0$. Thus,

$$g(x) \le \max_{x \in [-1,1]} g(x) = g(x_0).$$
 (72)

Now (68) and (72) show that

$$\left|\arg h\left(re^{it}\right)\right| \le \frac{\gamma\pi}{2}$$
 (73)

provided

$$\frac{r\left(3+r^2-4rx_0\right)\sqrt{1-x_0^2}}{2-r\left(5+r^2\right)x_0+4r^2x_0^2} \le \tan\left(\frac{\gamma\pi}{2}\right);\tag{74}$$

that is,

$$\tan\left(\frac{\gamma\pi}{2}\right) - \frac{r\left(3 + r^2 - 4rx_0\right)\sqrt{1 - x_0^2}}{2 - r\left(5 + r^2\right)x_0 + 4r^2x_0^2} \ge 0.$$
(75)

FIGURE 8: Image of $|z| \le 0.487998$ touches $|\arg w| = \pi/4$.

Thus, $|\arg h_2(z)| < \gamma \pi/2$ in D. Figure 8 shows that, for $\gamma = 0.5$, the radius $\rho_2 = 0.487998$ is sharp.

(c) Proceeding similarly as in part (a),

$$|h(z) - 1| < \operatorname{Re} h(z),$$
 (76)

provided

$$24r^{2}R^{2} - 8 + (18r^{2} - 1 - 17r^{4})R^{4} - 2(1 - r^{2})^{2}(1 - 3r^{2})R^{6} - (1 - r^{2})^{4}R^{8} < 0.$$
(77)

Let $\phi : (1/(1+r)^2, 1/(1-r)^2) \to \mathbb{R}$ be defined by

$$\phi(t) = 24r^{2}t - 8 + (18r^{2} - 1 - 17r^{4})t^{2} - 2(1 - r^{2})^{2}(1 - 3r^{2})t^{3} - (1 - r^{2})^{4}t^{4}.$$
(78)

Now

$$\phi'(t) = 24r^{2} + 2\left(18r^{2} - 1 - 17r^{4}\right)t$$

$$- 6\left(1 - r^{2}\right)^{2}\left(1 - 3r^{2}\right)t^{2} - 4\left(1 - r^{2}\right)^{4}t^{3}.$$
(79)

FIGURE 9: Image of $|z| \le 0.44915$ touches |w - 1| = Re w.

Let $r < \rho_3$. Since

$$\begin{split} \phi'\left(\frac{1}{(1+r)^2}\right) \\ &= \frac{4\left(-3+7r+12r^2+7r^3+r^4\right)}{(1+r)^2} > 0 \quad \text{if } r > 0.27606, \\ \phi'\left(\frac{1}{(1-r)^2}\right) \\ &= \frac{4\left(-3-7r+12r^2-7r^3+r^4\right)}{(1-r)^2} < 0, \end{split}$$

$$\end{split}$$
(80)

there exists a unique $t_0 \in (1/(1 + r)^2, 1/(1 - r)^2)$ such that $\phi'(t_0) = 0$ and $\max \phi(t) = \phi(t_0)$.

Then, for $0.27606 < r < \rho_3$,

$$\max\phi\left(t\right) = \phi\left(t_0\right) < 0. \tag{81}$$

When $r \le 0.27606$,

$$\max\phi(t) = \phi\left(\frac{1}{(1+r)^2}\right) = \frac{4\left(-3+r^2\right)}{(1+r)^2} < 0.$$
 (82)

Evidently, $\phi(t) < 0$ for $r < \rho_3$ and hence $|h_3(z) - 1| < \text{Re } h_3(z)$ in \mathbb{D} . Figure 9 shows that the radius $\rho_3 \simeq 0.44915$ is sharp.

Now, with $g(z) = z \in S\mathcal{T}(1/2), i = 1, 2, 3$,

$$\frac{f(z) * zh_{i}(z)}{f(z) * z} = \frac{f(z) * z \left(\frac{1}{(1 - \rho_{i}z) + \frac{1}{(1 - \rho_{i}z)^{2}} \right)}{f(z) * z}$$

$$= \frac{f(\rho_{i}z)}{\rho_{i}z} + f'(\rho_{i}z)$$

$$= \chi(\rho_{i}z) = \chi_{i}(z).$$
(83)

Lemma 2, together with (83) and the corresponding inequality for the function h_i , shows that each function χ_i satisfies the required condition. For sharpness, consider the function $f_0(z) = z/(1-z) \in \mathcal{CV} \subset \mathcal{ST}(1/2)$. Clearly

$$\frac{f_0(z)}{z} + f'_0(z) = \frac{1}{1-z} + \frac{1}{(1-z)^2} = h(z); \quad (84)$$

hence the fact that the number ρ_i is sharp follows from the definition of *h*.

For $\alpha = 0$, Theorem 5(a) reduces to the following corollary.

Corollary 6 ([14, Theorem 3, page 722]). If $f \in S\mathcal{T}(1/2)$, then

$$\operatorname{Re}\left(\frac{f(z)}{z} + f'(z)\right) > 0 \tag{85}$$

in $|z| < \rho = \sqrt{4\sqrt{2} - 5} \simeq 0.81$. The number ρ is sharp.

Theorem 7. Let $f \in \mathscr{CV}$, $\chi : \mathbb{D} \to \mathbb{C}$ be defined by

$$\chi(z) = \left(1 + \frac{zf''(z)}{f'(z)}\right) + \frac{1}{f'(z)},$$

$$\chi_i(z) = \chi(\rho_i z), \quad i = 1, 2.$$
(86)

Then,

(a) Re $\chi_1(z) > \alpha$, $0 \le \alpha < 1$, where $\rho_1 = \sqrt{3 - \sqrt{5 + 2\alpha}}$; (b) $|\arg \chi_2(z)| < \gamma \pi/2$, $0 < \gamma \le 1$, where $\rho_2 = \rho(\gamma) \in$

(0, 1) is the root of the equation in r

$$2r^{2}\sqrt{1-x_{0}^{2}}\left(r-\left(3+r^{2}\right)x_{0}+2rx_{0}^{2}\right)+\tan\left(\frac{\pi\gamma}{2}\right)$$

$$\times\left(2-r^{2}-r^{4}-4rx_{0}+\left(6r^{2}+2r^{4}\right)x_{0}^{2}-4r^{3}x_{0}^{3}\right)=0,$$
(87)

and $x_0 \in [-1, 1]$ is the root of the equation

$$6 - 5r^{2} - 4r^{4} - r^{6} + (-6r + 15r^{3} + 7r^{5})x_{0}$$

+ $(-12 - 8r^{2} - 16r^{4})x_{0}^{2} + (24r + 16r^{3})x_{0}^{3}$ (88)
 $- 16r^{2}x_{0}^{4} = 0.$

In particular,

$$\rho_2\left(\frac{1}{2}\right) \simeq 0.6355, \qquad \rho_2(1) = \sqrt{3 - \sqrt{5}}.$$
(89)

The radii are sharp.

Proof. Let

$$h(z) = \frac{2}{1-z} + (1-z)^2 - 1 \quad (z \in \mathbb{D}).$$
 (90)

(a) We claim that Re $h(z) > \alpha$ in $|z| < \rho_1$. By (22) and (23), it follows that

Re
$$h(z) = 2R\cos\theta - 1 + \frac{\cos 2\theta}{R^2}$$

= $\frac{1 + t^2 + r^4t^2 + 2t^3 - 2r^2(t + t^2 + t^3)}{2t^2}$ $(t := R^2)$
:= $\phi(t)$. (91)

A calculation shows that $\phi'(t) = 0$ if $t = t_0 = 1 \in (1/(1 + r)^2, 1/(1 - r)^2)$, $\phi''(t_0) = 3 - 2r^2 > 0$, and that

$$\min \phi(t) = \phi(1) = \frac{1}{2} \left(4 - 6r^2 + r^4 \right) > \alpha \tag{92}$$

over all $t \in (1/(1 + r)^2, 1/(1 - r)^2)$ provided

$$r^4 - 6r^2 + 4 - 2\alpha > 0. \tag{93}$$

This inequality reduces to $r \leq \rho_1$. Thus, Re $h_1(z) > \alpha$ in \mathbb{D} . Figure 10 shows that, for $\alpha = 0.5$, the radius $\rho_1 = \sqrt{3 - \sqrt{6}}$ is sharp. (b) Let $h(re^{it}) = u + iv$. Then

$$u = \left(2\left(1 - r\cos t\right) + \left(r^{2}\left(\cos^{2}t - \sin^{2}t\right) - 2r\cos t\right)\right)$$

$$\times \left(1 + r^{2} - 2r\cos t\right)\right)$$

$$\times \left(1 + r^{2} - 2r\cos t\right)^{-1},$$

$$v = \frac{2r\sin t\left(1 - (1 - r\cos t)\left(1 + r^{2} - 2r\cos t\right)\right)}{1 + r^{2} - 2r\cos t}.$$
(94)

By (94), it follows that

$$\arg h(re^{it}) = \arctan\left(\left(2r^{2}\left(-r + \cos t\left(3 + r^{2} - 2r\cos t\right)\right)\sin t\right) \times \left(2 + 2r^{2} - r\left(4 + 3r^{2}\right)\cos t + r^{2}\left(3 + r^{2}\right)\cos 2t - r^{3}\cos 3t\right)^{-1}\right).$$
(95)

Let

$$g(x) = \left(2r^{2}\left(-r + x\left(3 + r^{2} - 2rx\right)\right)\sqrt{1 - x^{2}}\right)$$

$$\times \left(2 + 2r^{2} - r\left(4 + 3r^{2}\right)x\right)$$

$$+ r^{2}\left(3 + r^{2}\right)\left(2x^{2} - 1\right) - r^{3}\left(4x^{3} - 3x\right)^{-1}.$$
(96)

A calculation shows that there exists $x_0 \in [0,1]$ such that $g'(x_0) = 0$ and $g''(x_0) < 0$. Thus

$$g(x) \le g(x_0), \quad x \in [-1, 1].$$
 (97)

By (95), (96), and (97), evidently

$$\left|\arg h\left(re^{it}\right)\right| \le \frac{\gamma\pi}{2}$$
 (98)

if

$$\frac{2r^{2}\left(-r+x_{0}\left(3+r^{2}-2rx_{0}\right)\right)\sqrt{1-x_{0}^{2}}}{2-r^{2}-r^{4}-4rx_{0}+\left(6r^{2}+2r^{4}\right)x_{0}^{2}-4r^{3}x_{0}^{3}} \qquad (99)$$

$$\leq \tan\left(\frac{\gamma\pi}{2}\right);$$

that is,

$$2r^{2}\sqrt{1-x_{0}^{2}}\left(r-\left(3+r^{2}\right)x_{0}+2rx_{0}^{2}\right)$$

+ $\tan\left(\frac{\gamma\pi}{2}\right)\left(2-r^{2}-r^{4}-4rx_{0}+\left(6r^{2}+2r^{4}\right)x_{0}^{2}-4r^{3}x_{0}^{3}\right)$
 $\geq 0.$ (100)

Thus, $|\arg h_2(z)| < \gamma \pi/2$ in D. Figure 11 shows that, for $\gamma = 0.5$, the radius $\rho_2 \simeq 0.6335$ is sharp.

To conclude the proof, let $g(z) = z/(1 - \rho_i z)^2 \in S\mathcal{T}$. Then,

$$\frac{f(z) * (z/(1-\rho_i z)^2) h_i(z)}{f(z) * (z/(1-\rho_i z)^2)} = \frac{f(z) * (z/(1-\rho_i z)^2) (2/(1-\rho_i z) - 1 + (1-\rho_i z)^2)}{f(z) * (z/(1-\rho_i z)^2)} = \frac{f(z) * (2z/(1-\rho_i z)^3 + z - z/(1-\rho_i z)^2)}{f(z) * (z/(1-\rho_i z))} = \left(1 + \frac{\rho_i z f''(\rho_i z)}{f'(\rho_i z)}\right) + \frac{1}{f'(\rho_i z)} = \chi(\rho_i z) = \chi_i(z).$$
(101)

As in the earlier proofs, Lemma 2 together with (101) and the corresponding inequality for the function h_i shows

FIGURE 10: Image of $|z| \le \sqrt{3} - \sqrt{6}$ touches Re w = 0.5.

FIGURE 11: Image of $|z| \le 0.6335$ touches $|\arg w| = \pi/4$.

that the function χ_i satisfies the required condition. For sharpness, consider $f_0(z) = z/(1-z) \in \mathscr{CV} \subset \mathscr{ST}(1/2)$. Then,

$$\left(1 + \frac{zf_0''(z)}{f_0'(z)}\right) + \frac{1}{f_0'(z)} = \frac{2}{1-z} - 1 + (1-z)^2 = h(z).$$
(102)

For $\alpha = 0$, Theorem 7(a) reduces to the following result.

Corollary 8 ([14, Theorem 4, page 723]). If $f \in \mathcal{CV}$, then

$$\operatorname{Re}\left(\left(1+\frac{zf''(z)}{f'(z)}\right)+\frac{1}{f'(z)}\right) > 0 \quad (103)$$

in $|z| < \rho = \sqrt{3 - \sqrt{5}} = (\sqrt{5} - 1)/\sqrt{2} \simeq 0.874032$. The result is sharp.
